

2015 TOCICO International Conference

# CCPM Transformation Challenges

Monday, September 7, 2015

Jack Warchalowski & Haell Khatib CMS Montera Inc.

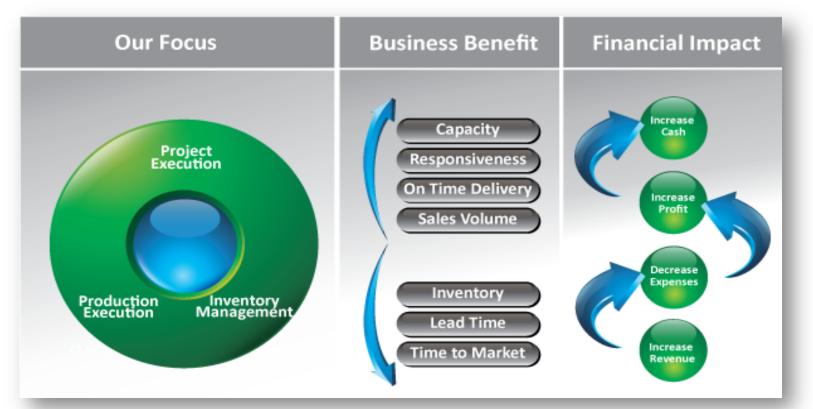

- Introduction
- Objectives
- CCPM solution
- CCPM benefits
- Implementation enablers
- Implementation challenges
- How to build a bridge
- Change Management issues

### Who is CMS Montera?

2015 TOCICO International Conference

 CMS Montera Provides Management Solutions and Software to Accelerate Projects and Optimize Operations

### **Presentation Objectives**

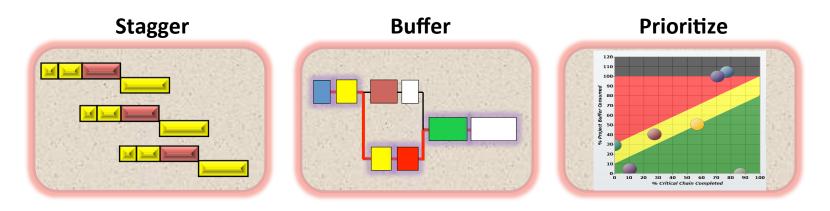

- Discuss common challenges preventing fast and effective CCPM transformation
- Suggest proven ways of speeding up CCPM implementations
- Describe some CCPM software capabilities required to enable change management principles

### **CCPM Solution**

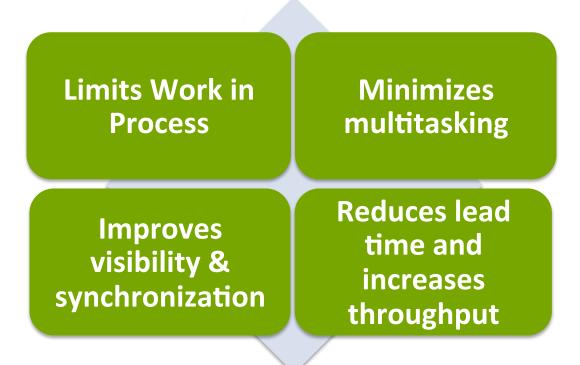

2015 TOCICO International Conference

- Stagger the release of projects into execution in order to limit the number of active projects in the pipeline
- Buffer project plans in order to better protect against unknowns
- Prioritize task execution based on project completion vs. buffer consumption

### **CCPM Benefits**

### **CCPM Benefits**

2015 TOCICO International Conference

 Most organization that decide to follow CCPM methodology can achieve the following results

# **Implementation Enablers**

2015 TOCICO International Conference

### Things to Avoid

- Releasing the project as soon as possible
- Creating fixed task schedule Map •
- Planning Project like a Train
  Schedule gains are lost
- Prioritizing based on Project Manager's judgement
- In-frequent Project / Task updates
  focused on work completed
- Focusing on Resource Efficiency -Assign Tasks to Resources to maximise resource utilization

### Things to Embrace

- Choking project release based on phase or resource loading
- Creating flexible tasks schedules- GPS
- Planning Project like a Relay Race gains are utilized
- Prioritizing based on Project Flow Index and Chain Delay
- Frequent Project / Task updates focused on work remaining
- Focusing on Task Efficiency Assign Resources to Tasks to minimize task duration

### **Implementation Challenges**

2015 TOCICO International Conference

Lack of "buy-in" to cutting Task Durations

Difficult to know when a vendor (outside resource) really needs to deliver to the schedule

**Starting Feeding Chains too early** 

"Just give me more dates"

If the Flow Index is below 1, how many days need to be recovered? (how to perform a "what-if" on various buffer recovery options)

### **Implementation Challenges**

2015 TOCICO International Conference

Difficult to prioritize among competing Feeding Buffers

Too much clutter on the Networks / too hard to maintain

Sometimes there is a requirement for fixed milestones

Difficult to manage very large projects – poor or no link with sub projects

No easy way to stagger projects and see impact on resource load

2015 TOCICO International Conference

Use aggressive durations for Internal Tasks

- Assume everything goes nearly perfect (optimistic duration)
- Add 50% buffer to all tasks (be positive <sup>(C)</sup>)

Specify 'expected' start dates of all chains and tasks

- Assumes all tasks will consume their buffer
- External Tasks split expected durations into 2/3 : 1/3

Base Resource Management on "expected' start dates

### Show 'Early Start Date' to mitigate risks

2015 TOCICO International Conference

Calculate Flow Index for ALL tasks relative to Project Buffer only

• Feeding buffers are used only to determine chain start date

Automate RDU updates for linearly declining task durations (Supply Chain, Lab testing, etc...)

#### Calculate Delay Days based on Flow Index

 Any task that consumes more / less than its allowable buffer adds / reduces Delay Days (Flow Index of 1 equals 0 Delay Days)

When needed, 'Fix' resource start dates and provide Delay Days impact of resource scheduling decisions (e.g. critical resource vacations)

2015 TOCICO International Conference

Create Gantt Charts based on task "expected" start dates and durations (no visible buffer, for external communication)

Link sub-projects to the main project buffer – provide visibility of the sub-project delay impact on the main project buffer

Enable What-if Capability by staggering projects based on Resource Group or Project Phase (Virtual Drum) and changing start date

## **Change Management Issues**

2015 TOCICO International Conference

A very effective and often used change management approach is to remove the "old system and process" to prevent people from migrating back

In our experience this is impractical since most of the tools are imperative to sustain the financial processes of the business (especially in large organizations)

In addition, there are many existing software tools to support traditional PM framework – CCPM software often adds to the plethora of tools

Therefore, the CCPM implementation and supporting software not only need to support CCPM processes but also provide a bridge to an already familiar PM framework to enable successful CCPM Transformation

### **Presenter Bios**

- Jack Warchalowski is the President of CMS Montera.
- Prior to CMS, Jack was the head of operations for the High Tech manufacturer, Ernst & Young management consultant, and a project engineer with Babcock & Wilcox.
- Jack is a Certified Management Consultant and a Professional Engineer registered in Ontario. He holds an MBA degree from the Wilfrid Laurier University and a Bachelor of Applied Science in Mechanical Engineering from the University of Waterloo in Waterloo, Ontario. In addition, Jack is certified by the TOCICO in all aspects of TOC.
- **Haell Khatib** is a Director Consulting with CMS Montera Inc.
- Prior to CMS, Haell has 15 years of experience in project engineering and process improvement
- Haell is a Project Management Professional (PMP) and a Professional Engineer registered in Ontario. He holds a Bachelor of Applied Science in Mechanical Engineering from the University of Waterloo in Canada. He is also certified by the TOCICO in Critical Chain Project Management.
